33. Power Station
34. Head of Government
35. Catholic Church
36. Russian Orthodox Church
37. Water Reservoir

2. Most of the streets shown in the sketch were reconstructed during the period 1933 to 1939 as follows: -

There were a few streets made of macadam over limestone. The sidewalks were of limestone about four and one half inches thick and about one yard square.

3. The primary sewers ran along Parnu Street and Dohja Duistee. These were about seven feet high and were about seven feet below the street level. The secondary sewers ran under the rest of the streets shown on the sketch. These were about four and one-half feet in diameter and were about seven feet below the street level. The curb gutters drained into the sewer at about 40 foot intervals along the street through six inch diameter tile tubes. Sewage from the buildings was also carried to the sewer by six inch diameter tile tubes. The sewers were vented to the street level at about 150 foot intervals.
4. About two feet under the sidewalks concrete blocks with many holes carried telephone wires, electric wires, gas, and water.
5. The water reservoir at (37) was on a hill and was a concrete covered metal tank reserve in case the pump pressure was too low to supply the higher buildings. The water for the city came from three underground settling tanks located at approximately $59^{\circ} 25' 10''$ N $24^{\circ} 46' 30''$ E and was supplied by the lake which was about 150 feet above sea level.
